17:00 - 20:00 - FSDI 103 Session #3 Ch27

Functions

- Create a function, use the word **function name** and **()**
- The functions have two steps: create and invoke (call it).
- The functions can have parameters, the parameter are local variables.
- global vars (you can access them from anywhere) and local vars (they are just alive in their code section)
- the best practice in JS is work with functions.
